a substantial increase in the number of studies using the optical properties absorbance and fluorescence of dissolved organic matter dom as a proxy for its chemical properties in estuaries and the coastal and open ocean has occurred during the last decade we are making progress on finding the actual chemical compounds or phenomena responsible for dom s optical properties ultrahigh resolution mass spectrometry in

particular has made important progress in making the key connections between optics and chemistry but serious questions remain and the last major special issue on dom optics and chemistry occurred nearly 10 years ago controversies remain from the non specific optical properties of dom that are not linked to discrete sources and sometimes provide conflicting information the use of optics which is relatively easier to employ in synoptic and high resolution sampling to determine chemistry is a critical connection to make and can lead to major advances in our understanding of organic matter cycling in all aquatic ecosystems the contentions and controversies raised by our poor understanding of the linkages between optics and chemistry of dom are bottlenecks that need to be addressed and overcome

carbon nanotubes are rolled up graphene sheets with a quasi one dimensional structure of nanometer scale diameter in these last twenty years carbon nanotubes have attracted much attention from physicists chemists material scientists and electronic device engineers because of their excellent structural electronic optical chemical and mechanical properties carbon nanotube research especially that aiming at industrial applications is becoming more important this book covers recent research topics regarding the physical structural chemical and electric properties on carbon nanotubes all chapters were written by researchers who are active on the front lines the chapters in this book will be helpful to many students engineers and researchers working in the field of carbon nanotubes
